

Abstract

A portable organizer, with multiple removable storage trays for receiving parts during the disassembly of a piece of apparatus, includes a rectangular frame with opposing side walls, a top, base, front and rear. A number of U-shaped trays are pivotally mounted to the frame side walls and coupled together to pivot in unison via a gang bar slidably mounted on the frame. The trays have an open top which is generally parallel to the frame front in a deployed position and inclined in a retracted position in which parts stored therein are readily accessible. The individual trays may be removed from the frame and placed near the disassembly site and then reinstalled in the frame for storage until the parts are required during the reassembly process.
